Education

Bachelor of Applied Science in Engineering Physics, *University of British Columbia*

2020 – 2025

Work Experience

Web Developer, *0Footprint Tech Services Inc*

Jul 2026 – Present

- Built an API-powered REST integration to pull and reconcile monthly subscription data across four platforms, streamlining a 3-hour manual reconciliation process to 20 minutes
- Designed and automated an end-to-end monthly invoicing pipeline using Python and Zapier, connecting shift and client data to trigger invoice creation across Stripe and QuickBooks
- Redesigned a listing media pipeline into a queue-based system on Cloudflare Workers (Durable Objects, Queues, KV), replacing a synchronous Zapier workflow and eliminating the timeout and upload failures it caused in production

Data Analyst, *Insurance Corporation of British Columbia | Road Safety Team*

May 2024 – Aug 2024

- Developed Python and SQL data pipelines to parse, clean, and validate 100,000+ records for a 10-year provincial road safety study, enabling analysis that informed strategic decisions
- Built a multi-agent traffic simulation in Java (MATSIM framework), modeling a 16 km² area with geospatial data
- Translated statistical findings into visualizations for non-technical stakeholders, converting raw analysis into actionable recommendations

Research Software Developer, *National Research Council Canada | Telescope Team*

Jan 2022 – Apr 2022

- Produced data visualizations analysing tradeoffs using Python (pandas, scikit-learn, scikit-rf) and Excel, directly informing the optimal detector range for the CCAT-Prime telescope's 850 GHz camera module, published in a peer-reviewed paper ([arXiv:2208.10634](#) [🔗](#))
- Analyzed detector-count tradeoffs (throughput vs. cost/complexity) using pandas and scikit-learn to identify the optimal detector range for instrument design, validating results against published benchmarks
- Continued collaborating with former NRC supervisor as of July 2026, providing data analysis and visualizations for an upcoming research paper

Projects

Walnut - AI Notetaking App [🔗](#), *iOS Frontend Development | SwiftUI, Figma, OpenAI API, Jira*

Sep 2024 – May 2025

- Learned SwiftUI from scratch to independently own iOS frontend development within a team project, shipping a working MVP under tight time constraints
- Ran 100+ user interviews to surface workflow pain points, directly shaping product direction and UX for an AI-powered lecture assistant
- Translated research findings into low-fidelity Figma prototypes and a managed Jira backlog, keeping cross-functional delivery on schedule

Orange Tree [🔗](#), *Playful Task-Management App | React, Firebase, Vite, Figma*

Feb 2026

- Learned React, Vite, and Firebase on the fly to independently take a full-stack app from idea to working product, solo
- Designed an original visual identity and design system (Figma, Procreate) and implemented the full UI independently

SeedBot [🔗](#), *Automated Seed-Sorting Test Bench | Python, OpenCV, Computer Vision*

Sep 2023 – Apr 2024

- Developed OpenCV-based seed detection and laser height-sensing subsystems for an automated seed sorting bench built on a Zaber 3-axis gantry
- Collaborated with an external sponsor (Insporos) and cross-functional teammates to hit throughput and precision requirements

Skills

(**Languages:** Swift, Python, Java, JavaScript, C++, SQL | **Web & APIs** SwiftUI, REST API design & integration, HTML/CSS, React, SwiftUI, Django (foundational), Firebase | **Data & ML:** pandas, scikit-learn, NumPy, OpenCv, PostgreSQL | **Tools & Platforms:** Git/GitHub, Jira, MATLAB, Figma, ArcGIS, Jupyter, Zapier, Claude)
